

STARTUP INVESTMENT ANALYSIS

Shark Tank India Dataset — Data Analysis Project

1. Introduction

This project analyzes startup investment patterns using a Shark Tank India dataset. The analysis focuses on deal outcomes, investment amounts, episode-wise investment, shark participation, and startups receiving the highest investment. The objective is to convert raw data into clear business insights using Python.

2. Abstract

The dataset contains 117 startup pitches and 28 attributes related to startup asks, deals, equity, shark participation, and investment values. Python and Pandas were used for data loading, exploration, aggregation and analysis, while Matplotlib was used for visualization. The analysis identified 65 closed deals and 52 pitches without a deal, with total recorded investment of ₹3,742 lakh.

3. Tools Used

Tool / Technology	Purpose
Google Colab	Notebook-based analysis environment
Python	Data analysis and calculations
Pandas	Data loading, filtering and aggregation
Matplotlib	Charts and visualizations
CSV Dataset	Shark Tank India startup data

4. Methodology / Steps

1. Loaded the Shark Tank India CSV dataset into Google Colab using Pandas.
2. Checked dataset dimensions and available columns.
3. Calculated total startups, closed deals, non-closed deals, total investment, average investment and average equity.
4. Analyzed total investment across episodes.
5. Calculated deal activity for each shark.
6. Calculated actual shark-wise investment using the amount-per-shark field.
7. Identified the top 10 startups by deal amount.
8. Created bar and line charts for the major findings.

5. Key Findings

Metric	Result
Total startups analyzed	117
Deals closed	65
Deals not closed	52
Total investment	₹3,742 lakh
Average investment	₹31.98 lakh
Average equity	8.96%
Highest investment startup	Aas Vidyalaya — ₹150 lakh
Most active shark	Aman — 28 deals
Highest actual investment by shark	Aman — ₹887.50 lakh

6. Conclusion

The analysis provides a concise view of startup investment activity in the available Shark Tank India dataset. A total of 117 startups were analyzed, with 65 deals closed and ₹3,742 lakh in recorded investment. The visualizations support comparison of deal activity, episode-wise investment, shark participation and top-funded startups. The dataset does not contain an industry or sector column, so industry-wise conclusions were not included.
